

## Expand Your Pet's Wireless Fence

protect. teach. love.®

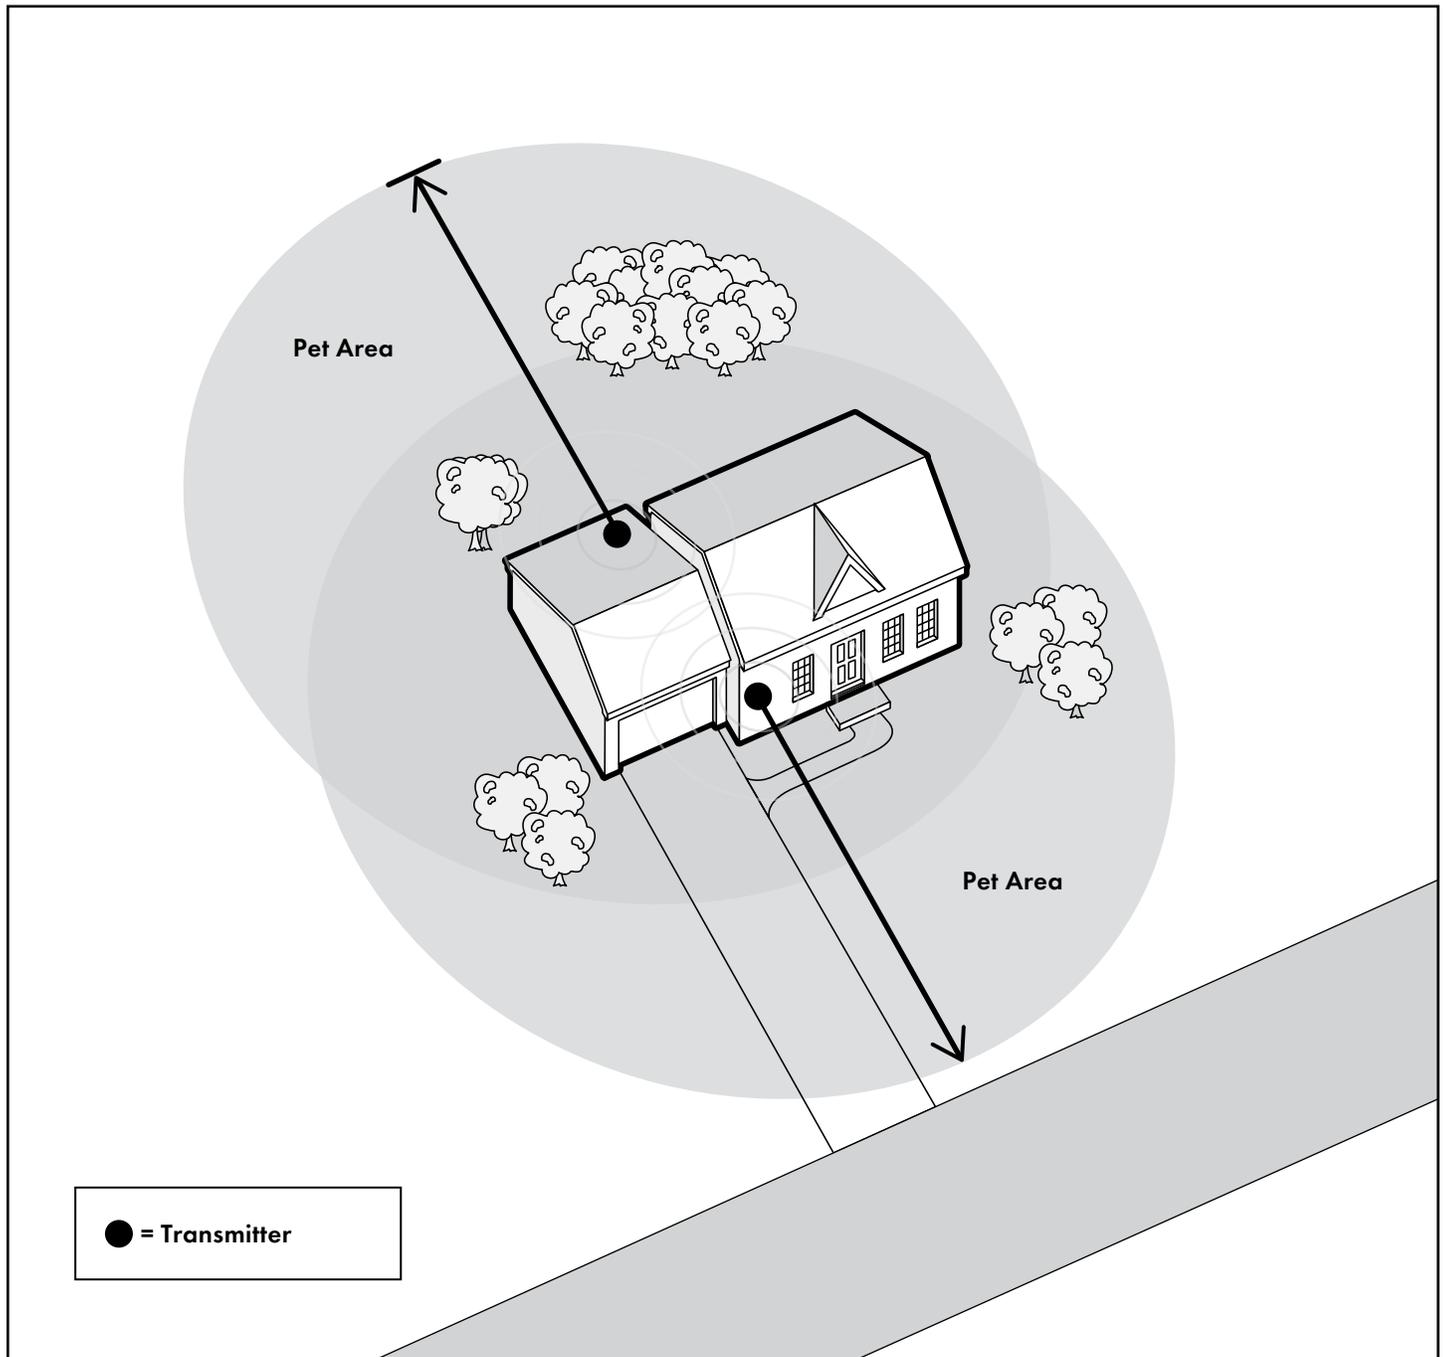

## Expand your pet area with the use of additional transmitters

You can increase the coverage of your pet's wireless fence by overlapping the ranges of 2 transmitters.

Overlapping the ranges of 2 transmitters creates one continuous area for your pet.

You can even combine different models of PetSafe® wireless transmitters.

Refer to the product manual or quick start guide for the range of each transmitter.

### Example 1

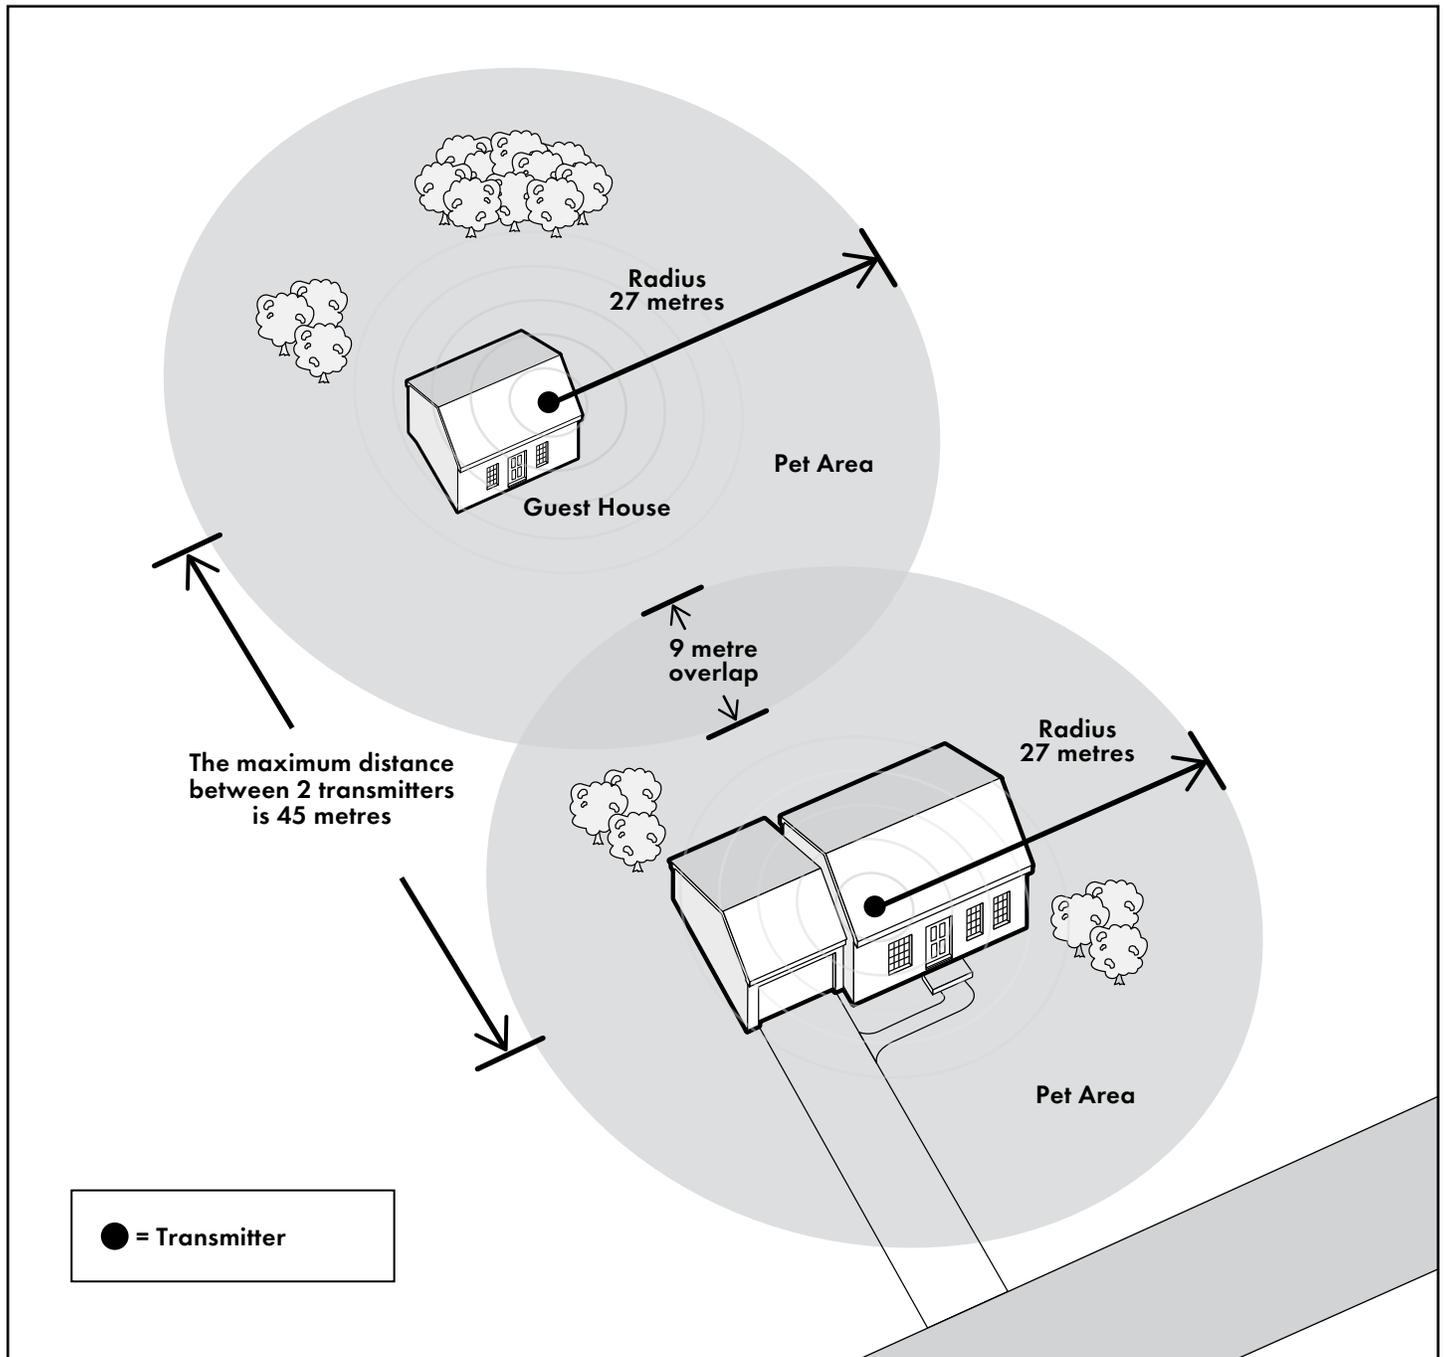

This example shows 2 transmitters in the home with proper overlap. This layout provides a larger pet area around the perimeter of the house than a single transmitter.

## Expand your pet area with the use of additional transmitters

The maximum range is at least 27 metres on any of the PetSafe® Wireless Fence systems.

It is recommended that you place the 2 transmitters no more than 45 metres apart. This allows for 9 metres of overlap coverage.

You will need to test the pet area and boundary range using the receiver collar.

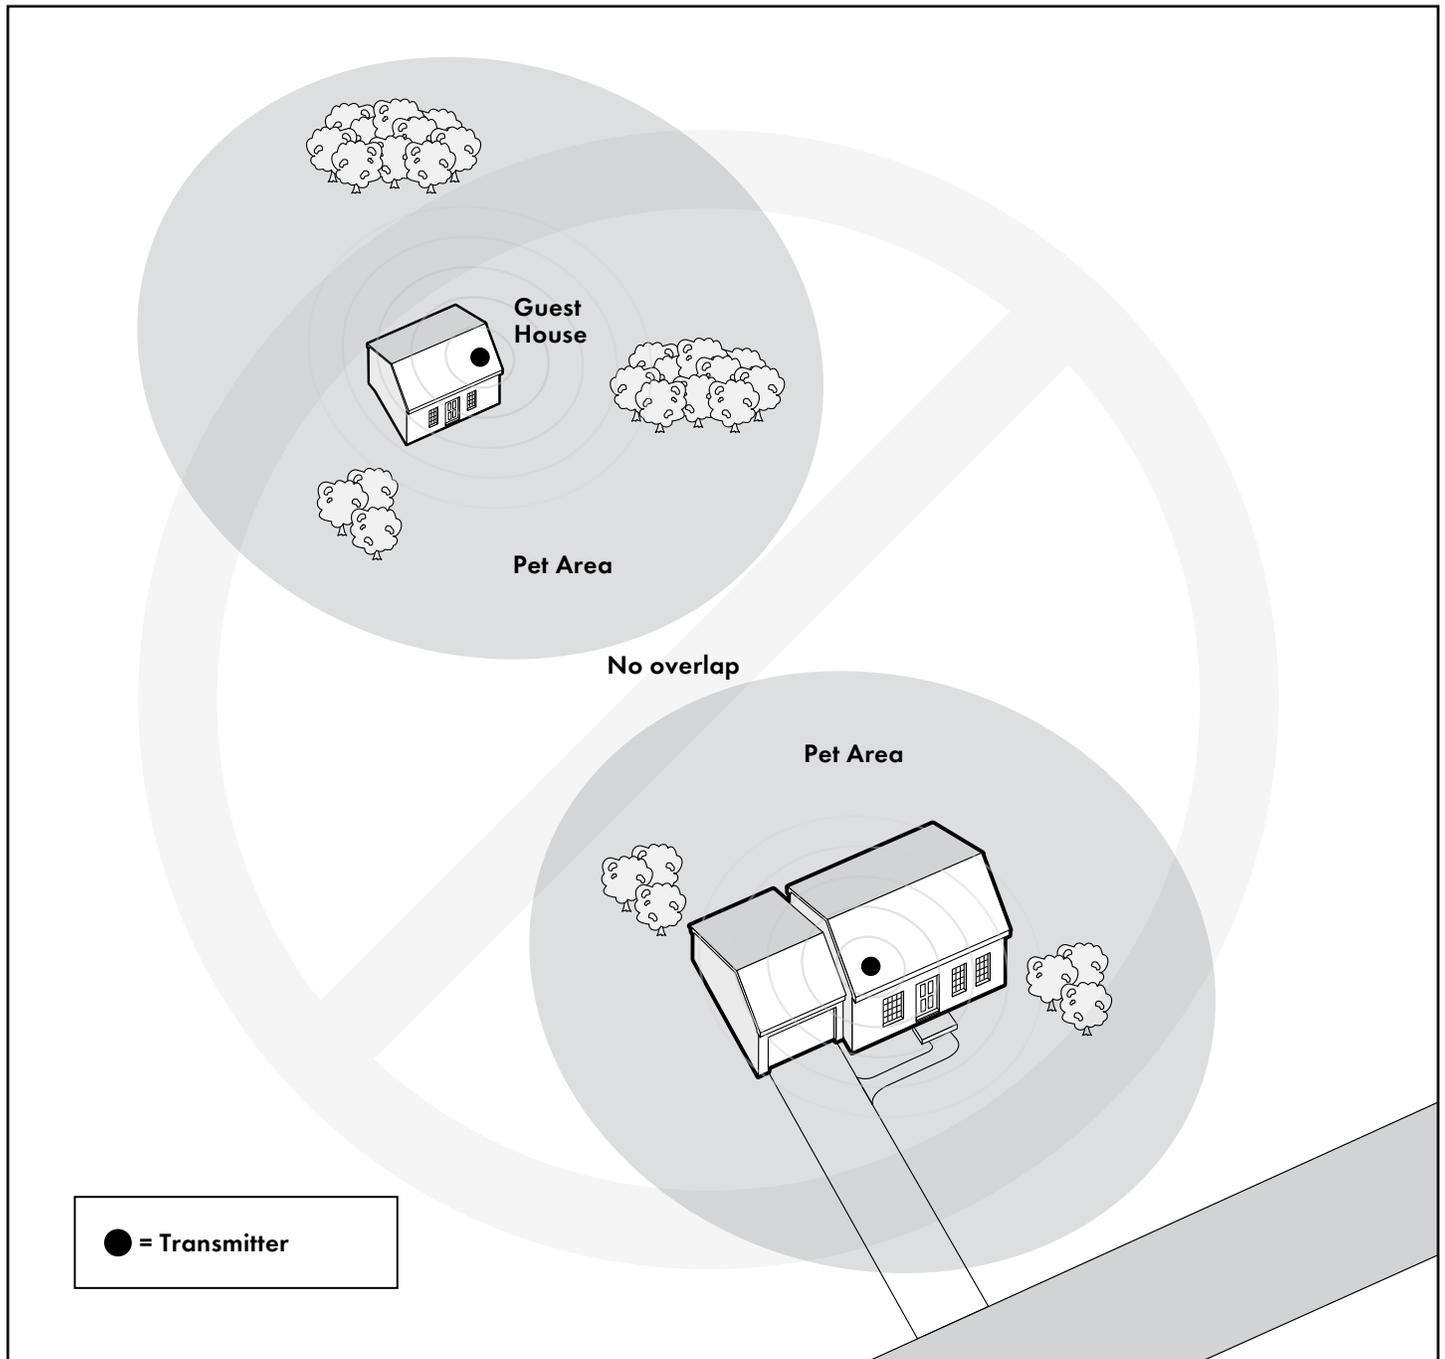

### Example 2

This example shows 2 transmitters in separate locations on the property with proper placement and overlap. The maximum distance between 2 transmitters is 45 metres. This allows for 9 metres of overlap coverage.

# Safety Information

Please review all safety and compliance information provided with the products that you will be using.

**CAUTION** To prevent an unintended stimulation, remove the receiver collar from your pet when indoors.

## Example 3

This example shows how NOT to set up 2 transmitters. Without overlap between the 2 transmitters, your pet will receive static stimulation in the area between the coverage zones. Coverage overlap should be at least 9 metres.
